

* Groups :- (Both dimension & measure)

→ Groups are static collection of values.

For example:-

If we want to color the annual revenue of USA midwest states with red & all the other cities with blue, then we can create a group of midwest states and use the created group to color the map.

here, we are using group because midwest states will always be the same.

* Sets (Dimension but not measure)

→ sets are dynamic collection of values.

for example:-

If you want to color the states with sum of annual revenue less than certain value, then in this case, we will create a set.

here, we are creating a set because the states in the set could change from one year to the other.

* combined sets

→ we can also create a set out of two other sets.

→ we have four options to combine
