* fact tables
-> fact tables store measurable, quantitative data
- the actual metrics you're analyzing, such
as revenue, users, or market share.
characteristics:-
-> contain numerical measures e.g., revenue,
ARPU, user count
-> are often large (many rows)
→ we toreign keys to reference
dimension tables
-> drive the main data context in
vi suali zation
* Dimension tables
-> Dimension tables store descriptive attributes
that give context to facts - like city names,

	Plan descriptions, or month labels.
Ch	aracteristics:
	-> contain text or category fields
	-> are usually smaller (fewer rows)
	-> wed to group, slice, and filter data
	-> often wed in filters, legends, and
	axis labels.
* Son	retimes while creating relationships, you
nee	d to create multi-fact relationships.
* For	multi-fact relationships, we need more
the	en one base tables.
for e	xample:
	market share cities
	lan_revenue date

Imeta	ios	plan
		- fact tables
		- dimension tables
X It is	recommended	to use the fact tables
as bas	e tables while	creating relationships
In tab	leau.
